

Users and Actions

Role	Can view/edit a draft created by others when
Advocate	They are added as an advocate on that case.
Clerk / Junior Advocate	An advocate they work for is added as an advocate on that case.
Litigant	They are added as a complainant on that case.
PoA-Holder	They are added as a complainant's PoA-Holder on that case.
Party-in-Person	They are added as a complainant on that case.

Notifications

Please note that there will be a master file containing notifications across the entire application. This will be the final source of truth. The message text here is very rough to indicate the contents, not the proposed final text.

Functional Requirements

Complainant and Advocate Details

- When a case is being filed, the complainant's details might already be present in the system. **Available details are auto-filled for convenience.** However, given that this is PII data, it can't be auto-filled without some form of approval (such as OTP verification).
- **An account is auto-created for new users** with the phone number and name, address, ID card etc
- The advocate details section requires information about who the complainants are so that the advocate-complainant mapping can be done. This means that there is a dependency between these two sections that the design must account for. In the current system, this is done by **preventing the user from accessing the advocate details section if the complainant details section is incomplete.**

Interlinked Date Fields

- In most cases, when a case is sent back for corrections, only the fields flagged by the scrutiny officer are editable. One exception is the **date fields that have intertwined**

validation dependencies (the date of the check return memo must be after the date of the check, the date of dispatch of the legal demand notice must be after the date of the check return memo, etc.).

If an error is flagged in one of these fields, the **connected downstream fields must also be opened for corrections** so that the case can be resubmitted with the validations not being violated.

Delay Condonation

- This **section depends on the Legal Demand Notice section**. That section must therefore be completed before this section can be accessed.
- This section shows a few additional fields that are to be entered if a delay is applicable (i.e., the case is being filed one month after the service of the Legal Demand Notice).
- In most cases, when a case is sent back for corrections, only the fields flagged by the scrutiny officer are editable. However, Delay Condonation is an exception. **If the DCA was not applicable at the time of initial filing but becomes applicable at the time of refiling —because one month had not yet passed from the service of the legal demand notice during the original filing, but has since elapsed — then the Delay Condonation section is opened for editing so that the newly required fields can be entered.**

Signing

- Users have the option to **choose between e-sign and upload a signed copy**. In the future, more options might become available.
- All complainants (or their PoA holders) and one advocate for each complainant must sign the case file.
- All parties must use the same mode of signing.
- If upload signed copy is selected, then the user is expected to collect all parties' signatures on the document before uploading. Therefore, once one user uploads the document, signature is considered complete for all parties.

Synopsis

- The synopsis is a small set of fields that **summarises the case**. This is **auto-generated** and shown after the case is moved to the signing stage. The fields are covered in [E-Filing Fields](#).

Prefilled Textboxes

- The [E-Filing Fields](#) includes **rich text fields that are pre-populated with text**. The text to be pre-populated is specified [here](#).

PDF Format

- The case file that is generated is in the PDF format as per the [complaint](#).

Payment

- The system provides the option to make upfront payments for processes (notice, summons, warrant). Depending on the state and with time, the number of rounds for which we collect.
 - **Out of the box, the system will calculate court fees and delivery channel fees for 1 round of summons and court fees for 4 rounds of warrants.**
- Upfront payment for 1 summons is mandatory. Notice is optional. The user can also opt in to pay upfront for up to four rounds of warrants.
- As per the latest design, a tentative amount to be paid is shown to the user by opting them into all of the upfront payments. The user should always have the choice to opt out.
- Payment is calculated as per the [Payment Logic](#).
- When a case is resubmitted after error correction, it's possible that some fields that affect the payment to be collected are changed (check amount, number of advocates). The **payment is recalculated during resubmission**, and if the new amount is greater than the previously paid amount, the balance is collected. This logic has already been built.
 - There is **no refund** if the new amount is lower than the previous one. However, once Scrutiny is passed, the system can generate refund notes to facilitate claims from e-treasury.

Scrutiny and Registration

- The scrutiny officer can send the case back for corrections multiple times. In general, **only the fields or sections marked as an error are editable, with the exception of the interlinked date fields and delay condonation fields**, as noted in previous sections.
- Once a scrutiny officer has forwarded the case to the magistrate, the magistrate can also send the case back for corrections. In this case, specific fields are not marked. Instead, all fields open up for editing.
